

Anas_Ali

./app_developer

>_ ~/properties

Innovative Computer Science student and freelance software developer specializing in cross-platform applications. Experienced in delivering scalable, user-centric solutions using Flutter, web development, and n8n automation. Passionate about UI/UX design and building robust backend architectures for dynamic environments.

○ Software Developer

2025 - PRESENT

@ Freelancer & Personal Projects

Anas Space | Cross-Platform Media Synchronization App

- Developed a comprehensive, cross-platform gallery application designed for efficient media management and secure storage.
- Engineered a custom bridge server enabling seamless, local Wi-Fi media synchronization across multiple devices.
- Implemented modular security features, including a PIN protected media locker to ensure data privacy and secure storage.

WE Two | Secure Real-Time Connection Application

- Built a private, personalized connection application utilizing Flutter for the frontend and Supabase for backend infrastructure.
- Designed a fully customized, thematic user interface while effectively managing secure authentication and real-time database synchronization.

Blur | Swipe-Based Social Networking Application

- Engineered a high-performance, cross-platform social application featuring intuitive swipe-based mechanics and real-time world chat functionality.
- Optimized graphical rendering and user experience by migrating from 3D WebGL models to a custom, natively rendered sphere using the Impeller engine

○ Lead Project Developer

2024 - PRESENT

@ UET Taxila

UET Navigation System | Campus Mapping & Pathfinding Application

- Developed a comprehensive campus navigation system to map university landmarks and efficiently guide students and visitors.
- Implemented Dijkstra's algorithm and complex graph data structures in C++ for optimal route calculation.
- Seamlessly integrated the backend pathfinding logic with a cross-platform Flutter frontend utilizing dynamic libraries.

OS Simulator | Interactive OS Concepts Visualizer

- Created a professional educational tool using Python and Streamlit to visually simulate core operating system mechanisms.
- Programmed dynamic models to demonstrate and teach complex CPU scheduling and memory management algorithms.

Virtual Pet | Console-Based C++ OOP Application

- Developed an interactive console application in C++ to simulate a virtual pet, demonstrating a strong understanding of core Object-Oriented Programming (OOP) principles.
